151	Hoc verò cum redarguerent observationes: falsum igitur apparuit illud tantuæ appropinquationis dogma, Copernicus, hac causa in phænomeni convulsâ, substitutâ, reali, & ipsam, Epicyclos duos pro Ptolemaico uno, majorem quidem, qui centrum minoris veheret, minorem, qui Lunam ipsam, in Quadrâ eam præstans remotissimam à centro majoris.	051																																																	
201	Quid faceret Tycho, totus perfectioni motuum tunc addictus, in circulus perfectis? Copernicum imitari etiam in Mensuræ inæqualitatib[us] positionibus etat difficile; jam dudum enim propter Solutam Anomaliam, de qua superiori capite, duos receperat Epicyclos. Quorū jam rep̄overet tertium, quem Copernicus dedit Anomalie menstruæ? Nimirum ex Orbe Lunæ excerptum, Terræ applicuit, centrum ejus locans in linea, quæ parallela esset lineæ Apogei Epicycli, in hujus jam non Epicycli sed Hypocycli circumferentiâ fixum centrum Orbis Lunæ, duos priores Epicyclos deferentis, sic incedere jussum est, ut in Cöpulis veniret in ipsum centrum Terra; in Quadrâs ab eo longissime omnium recederet. Et tamen adhuc aliam Tycho Variationem deprehendit, in obseruatam veteribus; cuius effectrices machinæ non est auctus inferre Systemati orbium Lunæ; transcriptis igitur eos ipsi Zodiaco. Oculos aperuit illi tandem hec inæqualitas ultima; ut videre inciperet, non circulis realibus, sed causis naturalibus aliis, has inæqualitates effici. Quid ego, Tychone mortuo? Dicam verbo: Nodus Gordium nihil attinebat solvere, leui. Post diuinas enim contemplationes, post transformationem non unam, tandem approavit Anomalie menstruæ causâ, nihil mittandum nec in figura Orbitæ Lunæ, nec in ejus intervallis; omnem enim eam sequi rationes illuminationis; ad quas, motuum ejus initiationes refractione, & ejus naturales, seu vi lucis ipsius, seu ministerio animali accommodarentur. Demonstraciones ipsas longum est hic explicare, petat eas, qui desiderat, ex Epitoma Altron. Magis est ex instituto praesentis operis, Schematum explicatione, fundamenta struere calculi, ne ijs ignoratis, inanior fiat Calculi labor, per se fatis tedious, ob mirans cautionem varietatem, quas parit haec non posita de novo, sed ultrò ex Naturâ oblatâ Hypothesis.	001
